Project name on Kaggle: Quora Insincere Questions Classification

Background: Quora is a platform that empowers people to learn from each other. On Quora, people can ask questions and connect with others who contribute unique insights and quality answers. However, there're always insincere questions (those founded upon false premises, or that intend to make a statement rather than look for helpful answers) on Quora which goes against the policy of Quora – Be Nice, Be Respectful.

Goal: Given Quora question text, predict whether a question asked on Quora is sincere or not.

Feasible solution: Utilize deep neural network such as RNN, LSTM and then ensembling them.
